

Search Fixture

latex-editor test data

Section One. The purpose of this page is to give the search tests a document with real, extractable text. The words on the page are ordinary English so that the token “the” appears many times on every page, which is what the viewer searches for. The layout is deliberately plain: no figures, no bibliography, no external packages beyond the page geometry.

The second paragraph exists so that the page has enough height for the scroll range to be non zero. The viewer test moves the scroll bar to the middle of the range and then checks that restoring the search results does not move it back to the top. Without enough text the range would be zero and the gate would run empty.

Section Two. The purpose of this page is to give the search tests a document with real, extractable text. The words on the page are ordinary English so that the token “the” appears many times on every page, which is what the viewer searches for. The layout is deliberately plain: no figures, no bibliography, no external packages beyond the page geometry.

The second paragraph exists so that the page has enough height for the scroll range to be non zero. The viewer test moves the scroll bar to the middle of the range and then checks that restoring the search results does not move it back to the top. Without enough text the range would be zero and the gate would run empty.

Section Three. The purpose of this page is to give the search tests a document with real, extractable text. The words on the page are ordinary English so that the token “the” appears many times on every page, which is what the viewer searches for. The layout is deliberately plain: no figures, no bibliography, no external packages beyond the page geometry.
